WEB DEVELOPMENT

ACTIVITY-BASED LEARNING

Long Presentation & Project Report

Project Repository	WD-Activity-Based-Learning
Activities Documented	8th Activity, 9th Activity, 18th Activity
Web Technologies	HTML5 and CSS3
Project Type	Static Front-End Websites
Prepared From	Submitted browser and GitHub screenshots

Submitted as a consolidated visual and technical presentation report.

CERTIFICATE / PROJECT DECLARATION

This report presents the web-development activities demonstrated through the supplied screenshots. The document consolidates the project repository evidence and the rendered web pages into a single presentation-style report for academic/project documentation.

Project Area	Web Development / Front-End Design
Primary Markup	HTML
Primary Styling	CSS
Activities Covered	Food Ordering, Bakery, Hotel Reservation
Documentation Type	Screenshot-based project presentation

Note: This report describes only features visible in the submitted screenshots; it does not assume hidden backend functionality.

TABLE OF CONTENTS

1	Introduction
2	Project Objectives
3	Tools and Technologies
4	Repository and File Organization
5	Activity 8 – Foodie Online Food Ordering Website
6	Activity 9 – Sweet Treats Bakery Website
7	Activity 18 – Dream Stay Hotel Reservation Website
8	User Interface and Design Analysis
9	Forms and User Interaction
10	Testing and Visual Verification
11	Strengths of the Project
12	Limitations and Suggested Improvements
13	Learning Outcomes
14	Conclusion
15	Appendix – Screenshot Evidence

1. INTRODUCTION

The submitted work is a collection of activity-based web-development exercises. The screenshots show a GitHub repository named **WD-Activity-Based-Learning** and several completed webpages opened in a desktop browser. The activities focus on designing practical, user-facing websites using HTML and CSS.

Three major website themes are represented in the evidence: an online food ordering interface, a bakery website, and a hotel reservation interface. Although the themes are different, all three follow a common web-page structure: branding at the top, navigation, a main content area, visually distinct sections, cards or forms, and a footer.

The purpose of this report is to transform the individual screenshots into a long-form presentation document. It explains the project goals, technologies, visible functionality, design decisions, testing observations, learning outcomes, and possible future improvements.

2. PROJECT OBJECTIVES

- Create visually structured web pages using HTML and CSS.
- Practice organizing content into headers, navigation bars, sections, cards, forms and footers.
- Present product, service and pricing information in a user-friendly format.
- Apply consistent typography, spacing, colors, borders, shadows and alignment.
- Build realistic examples based on common real-world website categories.
- Publish and organize activity files in a GitHub repository.
- Verify the final appearance by opening the pages in a browser.

3. TOOLS AND TECHNOLOGIES

HTML5

HTML provides the structure of the webpages. The screenshots show typical structural elements such as headings, paragraphs, navigation links, images, buttons, cards, form fields, labels and footer content. These elements are arranged into separate sections to make each page readable.

CSS3

CSS is responsible for the visual presentation. The pages demonstrate background colors, text colors, font sizing, spacing, rounded corners, shadows, button styling, card layouts and section separation. The repository screenshot also shows separate CSS files corresponding to the activities.

GitHub

The project is stored in a public GitHub repository named **WD-Activity-Based-Learning**. The repository screenshot shows activity-specific HTML and CSS files together with a README file. This demonstrates basic source-code organization and versioned project submission.

Web Browser

The webpages were rendered in a desktop browser from local HTML files. This provides visual evidence that the HTML and CSS were interpreted successfully and that the intended sections appeared on screen.

4. REPOSITORY AND FILE ORGANIZATION

The first submitted screenshot shows the GitHub repository and provides the project-level context. The repository contains separate HTML and CSS files for different activities, including the 8th, 9th and 18th activities. A README file is also present.

Observed repository structure

File / Group	Purpose
8th activity.html	HTML document for the Foodie website.
8th activity.css	CSS styling associated with the Foodie website.
9th activity.html	HTML document for the Sweet Treats Bakery website.
9th activity.css	CSS styling associated with the bakery website.
18th activity.html	HTML document for the Dream Stay Hotel website.
18th activity.css	CSS styling associated with the hotel website.
README.md	Repository documentation/readme content.

The repository organization makes it possible to keep each activity independent while maintaining all exercises under a single learning project.

5. ACTIVITY 8 – FOODIE ONLINE FOOD ORDERING WEBSITE

The Foodie website is designed as a simple online food ordering landing page. Its visual theme uses a strong red header and warm orange/yellow hero area, creating a food-focused and energetic appearance. The page introduces the service, presents menu items with images and prices, advertises an offer, and displays customer reviews.

Major visible features

- Branding with the Foodie name and a pizza emoji/logo treatment.
- Navigation links for Home, Menu, Offers and Reviews.
- Hero message: “Delicious Food at Your Doorstep!” with an Order Now button.
- Menu cards for Pizza, Burger, Chicken Biryani and Desserts.
- Food images, short descriptions and Indian-rupee pricing.
- Special offer section advertising 20% off with coupon code FOOD20.
- Customer reviews with star ratings.
- Footer containing copyright and contact email information.

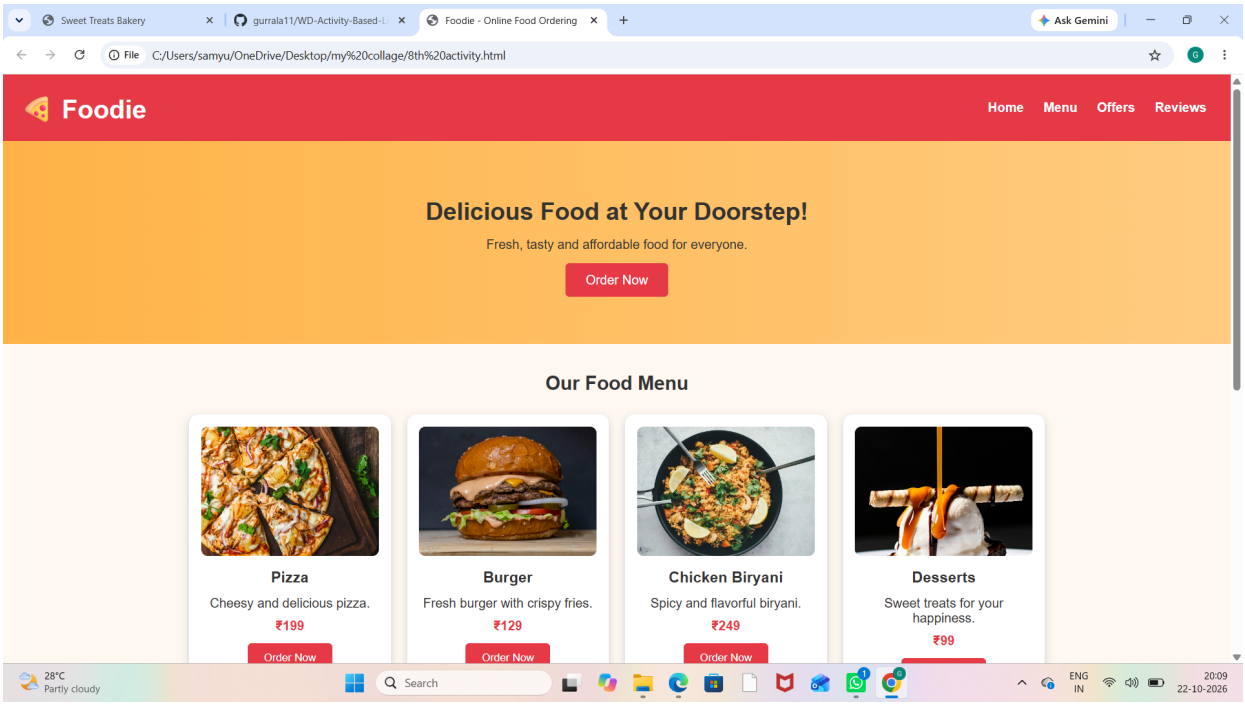

Figure 2. Foodie homepage showing the navigation bar, hero section and menu cards.

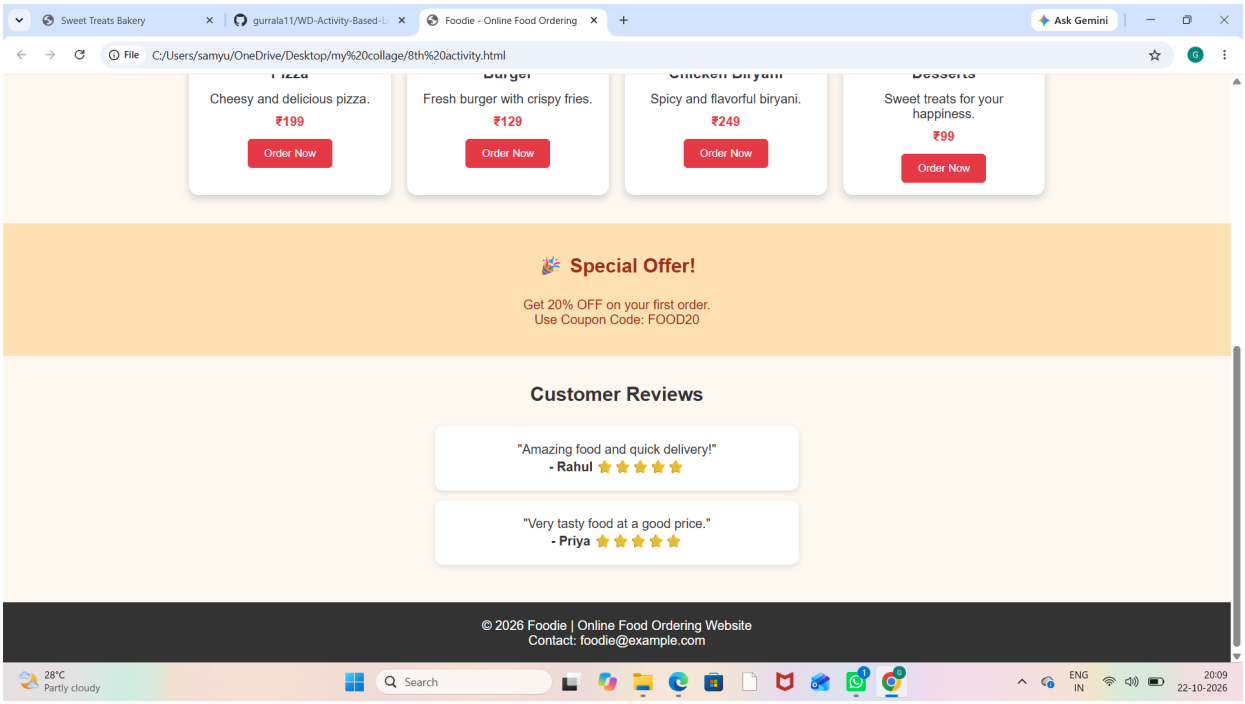

Figure 3. Foodie lower page showing the special offer, customer reviews and footer.

6. ACTIVITY 9 – SWEET TREATS BAKERY WEBSITE

The Sweet Treats Bakery page presents a bakery-oriented business website. The design uses a burgundy and light-pink visual identity. It contains product presentation, a custom-cake showcase, promotional information, and contact details.

Major visible features

- Bakery brand header with the tagline “Fresh Cakes, Sweet Memories!”.
- Navigation for Home, Products, Custom Cakes, Offers and Contact.
- Welcome section introducing cakes, pastries and cookies.
- Product cards for Chocolate Cake, Fresh Pastries and Cookies.
- Visible product prices in Indian rupees.
- Custom Cake Designs section featuring a decorated multi-tier cake.
- Seasonal offers including a festival discount and birthday-cake candle offer.
- Contact section with address, phone and email information.
- Footer with copyright information.

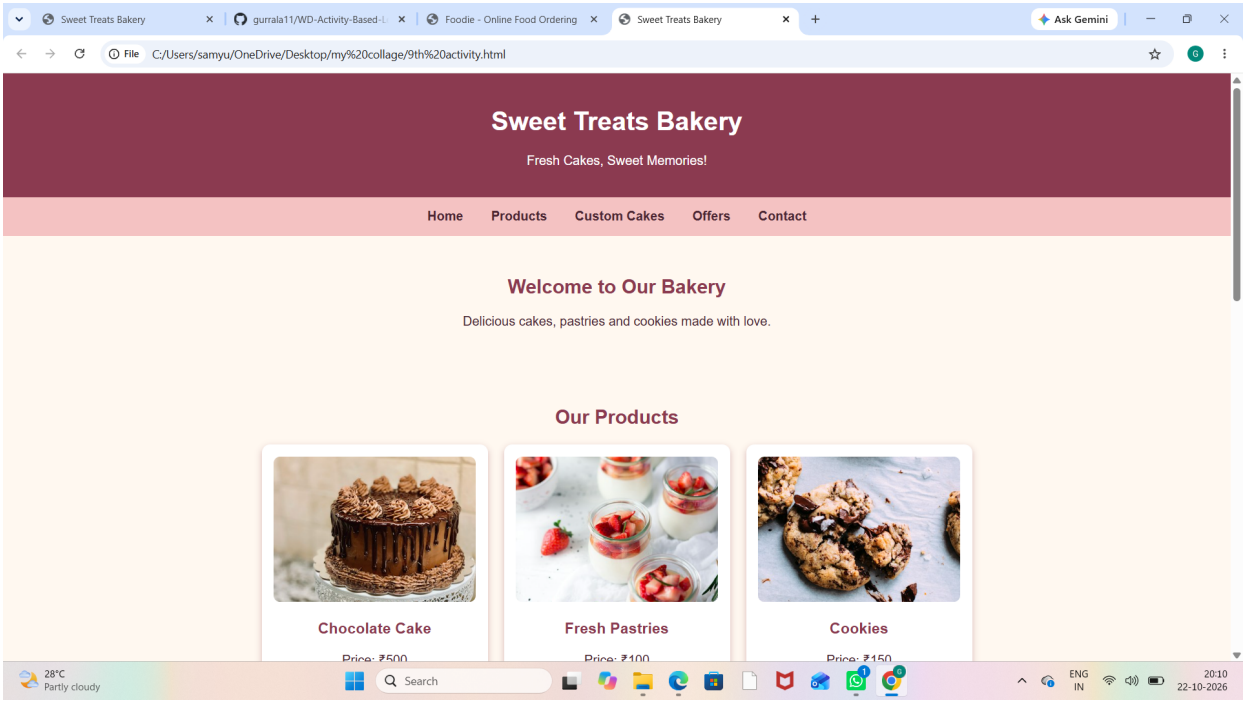

Figure 4. Sweet Treats Bakery homepage with branding, navigation and product cards.

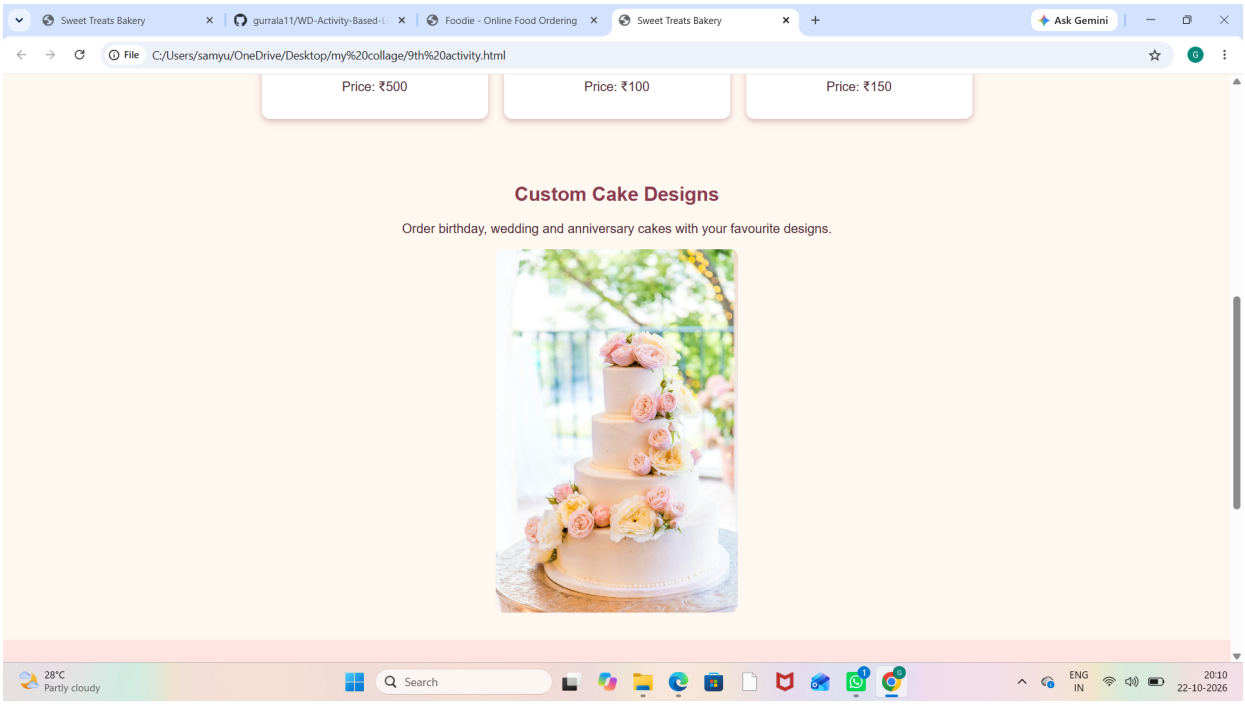

Figure 5. Bakery custom cake design section and product pricing.

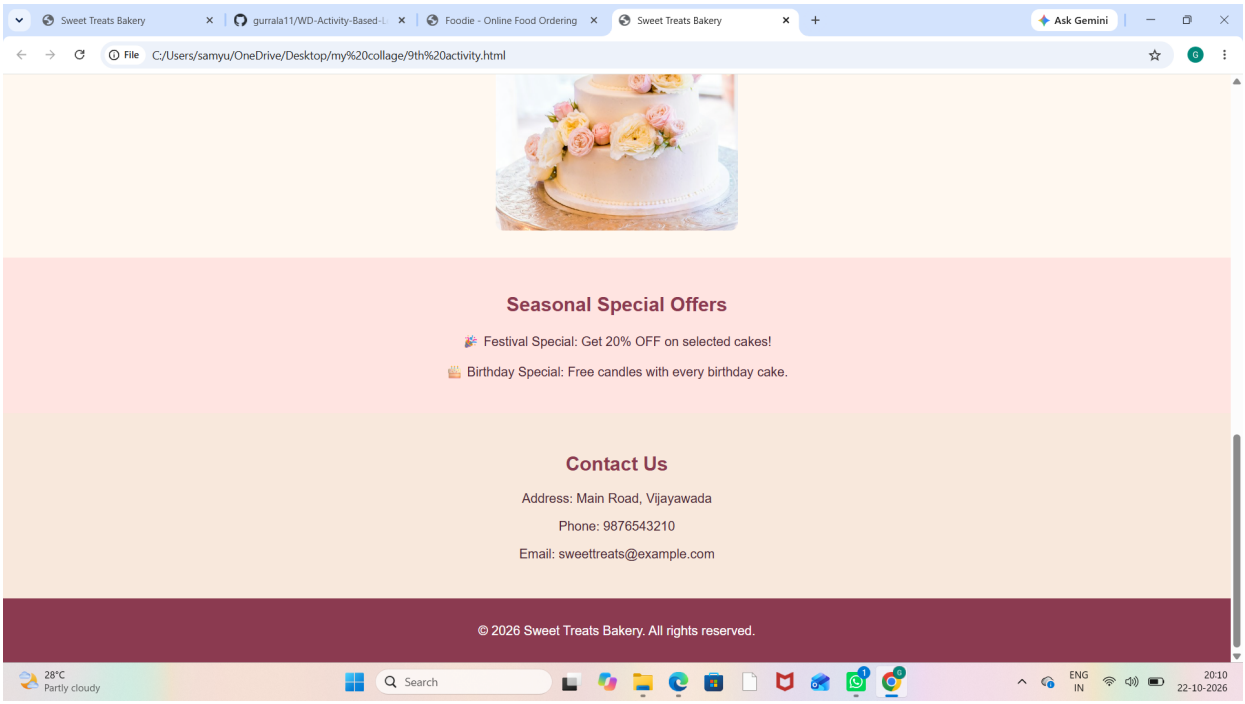

Figure 6. Bakery seasonal offers, contact information and footer.

7. ACTIVITY 18 – DREAM STAY HOTEL RESERVATION WEBSITE

The Dream Stay Hotel page is a hotel presentation and room-reservation interface. The page uses a dark-blue header with a teal navigation bar and light blue/gray content areas. It combines hotel marketing content with a reservation form.

Major visible features

- Hotel branding with the title Dream Stay Hotel and a comfort/luxury tagline.
- Navigation links for Home, Rooms, Facilities and Reservation.
- Welcome section with a Book Now call-to-action.
- Room category cards: Standard Room, Deluxe Room and Luxury Suite.
- Nightly room prices displayed in Indian rupees.
- Facilities list including Wi-Fi, swimming pool, restaurant, room service, parking and air conditioning.
- Reservation form with name, email, room category, check-in date, check-out date and number of guests.
- Reserve Now button and a copyright footer.

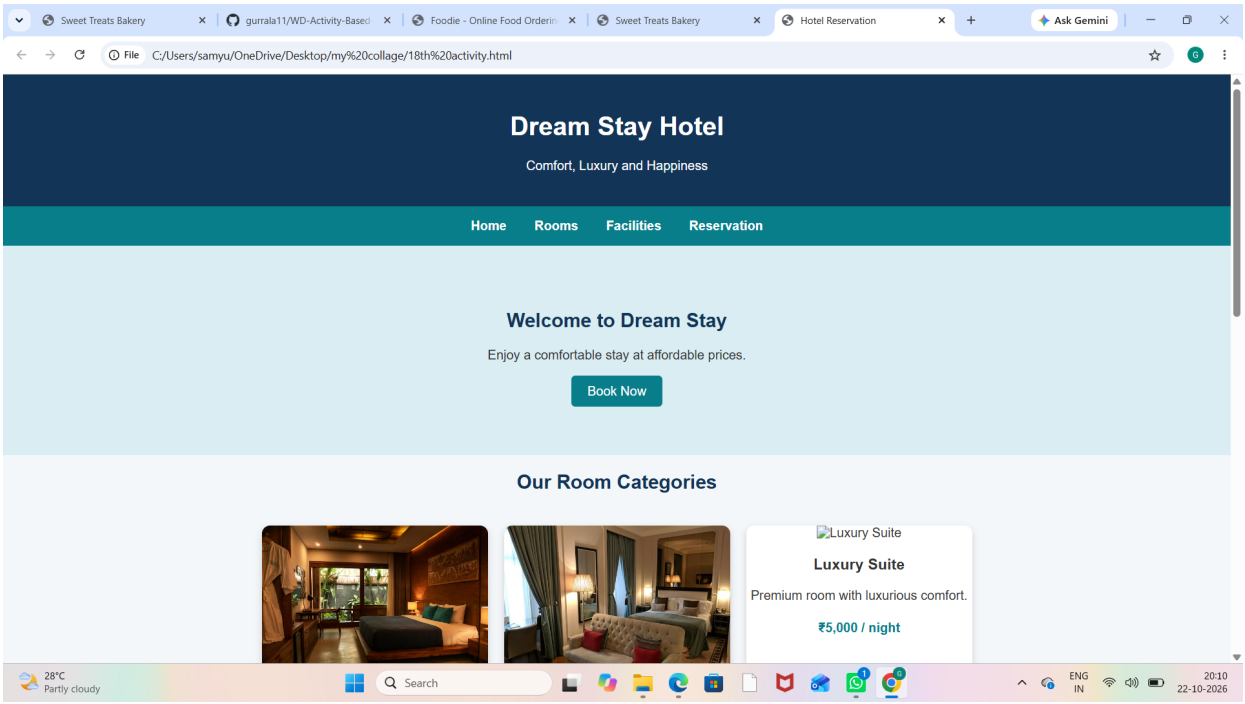

Figure 7. Dream Stay Hotel homepage, room categories and hotel presentation.

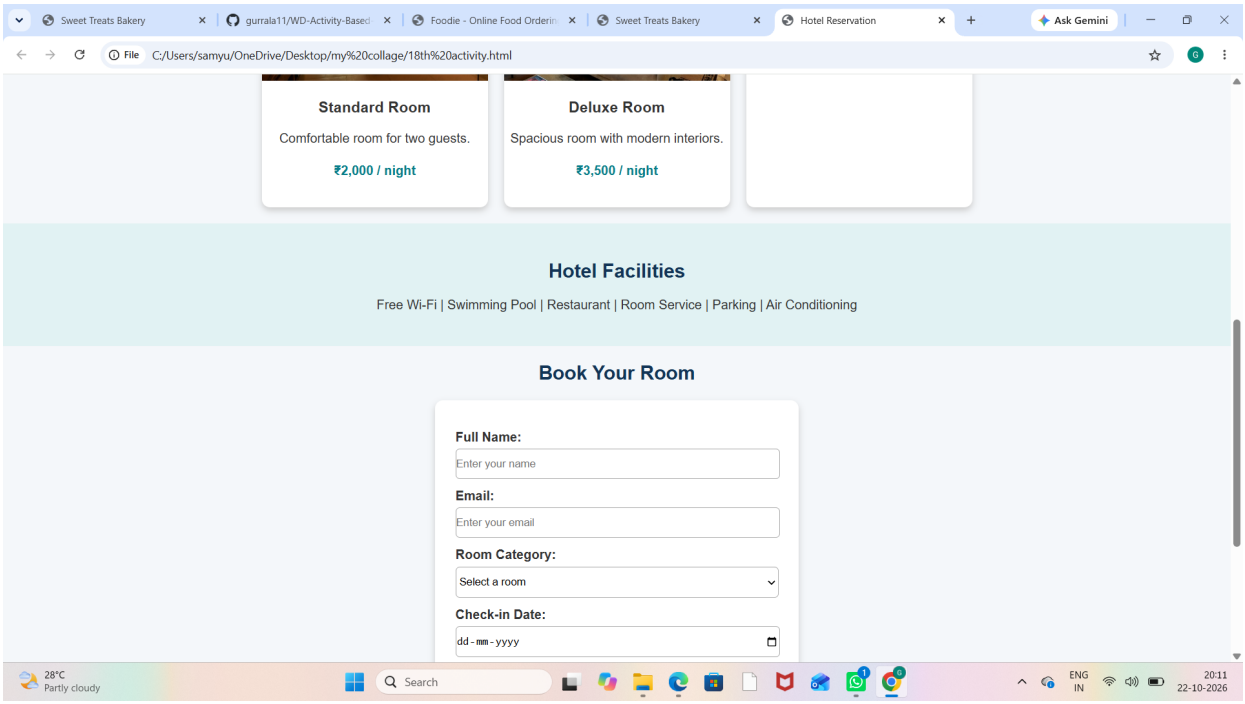

Figure 8. Hotel facilities and the beginning of the room reservation form.

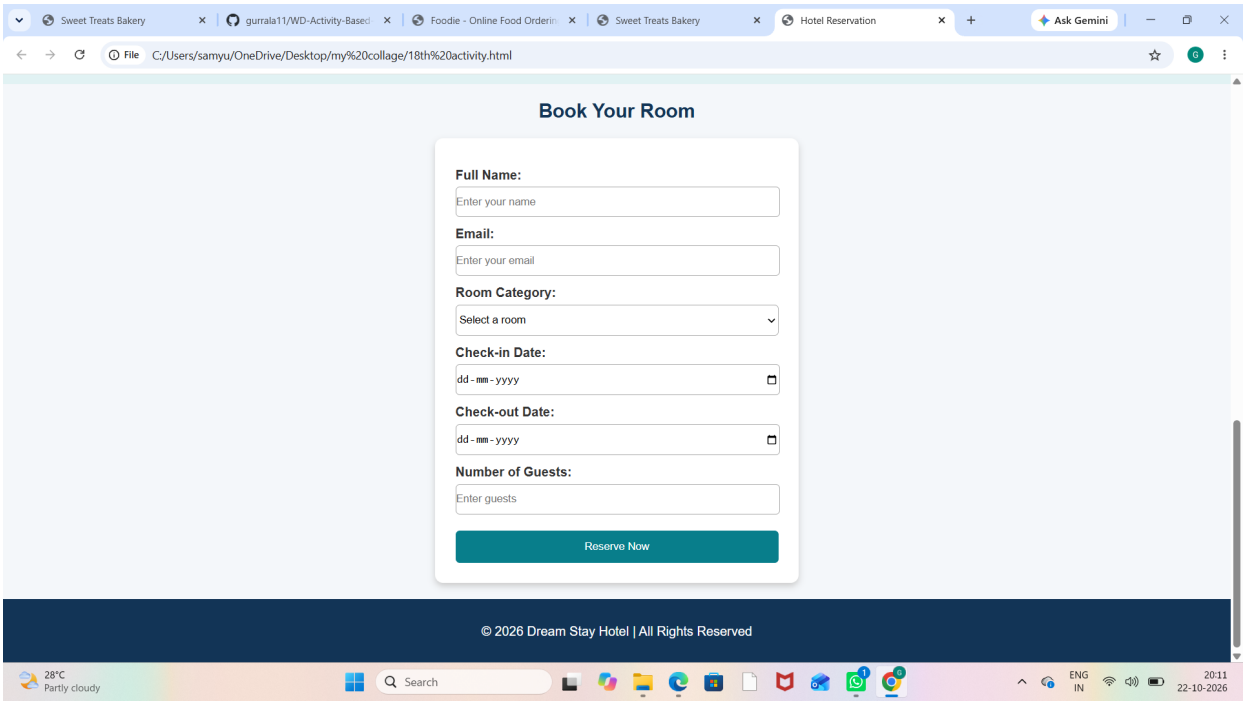

Figure 9. Complete reservation form and footer.

8. USER INTERFACE AND DESIGN ANALYSIS

Layout

All three projects use a section-based layout. A header establishes identity, navigation helps users move through the page, and the main content is separated into visually distinct blocks. Cards are used where multiple items need to be compared, while wider sections are used for promotional and informational content.

Color and Branding

The color palettes are matched to the subject matter. Foodie uses energetic red and orange tones; Sweet Treats Bakery uses burgundy, pink and cream; Dream Stay uses dark blue, teal and pale blue. This demonstrates how color can help establish a recognizable identity for a webpage.

Cards and Visual Hierarchy

The Foodie and bakery pages use image cards to present products. The hotel page uses cards for room categories. Headings, descriptions, prices and buttons are arranged in a hierarchy that allows users to identify the main information quickly.

Navigation

Each website has a navigation bar containing links to major page sections. This provides a familiar website structure and supports quick access to relevant information.

Footer Design

The footer areas provide a visual end point for each page. They contain copyright text and, where applicable, contact information. Consistent footer placement improves the completeness of the pages.

9. FORMS AND USER INTERACTION

The hotel project includes the most detailed user-input section among the supplied screenshots. The “Book Your Room” form is presented as a centered card and contains multiple controls for collecting reservation information.

Field	Purpose
Full Name	Identifies the person making the reservation.
Email	Provides a contact address for the reservation.
Room Category	Allows the user to select a room type.
Check-in Date	Captures the arrival date.
Check-out Date	Captures the departure date.
Number of Guests	Captures the expected guest count.
Reserve Now	Provides the main form submission action.

The screenshots establish the visual presence of the form. Whether the reservation is connected to a server, database or payment system is not shown in the supplied evidence and therefore is outside the scope of this report.

10. TESTING AND VISUAL VERIFICATION

Testing for this report is based on the visible browser rendering shown in the screenshots. The objective is to verify that major page sections are present, readable and visually organized.

Test Area	Expected Result	Observed in Screenshots
Page loading	Page renders in browser	Pass – all submitted pages are visibly rendered.
Navigation	Navigation bar is visible	Pass – navigation links are displayed on all three sites.
Images	Relevant images appear in content	Pass – product, food, room and cake images are visible.
Pricing	Prices are readable	Pass – prices are shown on menu, bakery and room cards.
Forms	Reservation fields are visible	Pass – hotel reservation fields are displayed.
Promotions	Offer sections are distinguishable	Pass – Foodie and bakery promotional sections are visible.
Footer	Page ends with footer information	Pass – footer areas are visible in the supplied screenshots.

Additional verification recommendations

- Check every navigation link after hosting the pages.
- Validate HTML and CSS for syntax errors.
- Test the pages at mobile, tablet and desktop widths.
- Test form validation and submission behavior.
- Optimize image file sizes for faster loading.
- Confirm that all image paths work after deployment to GitHub Pages or another host.

11. STRENGTHS OF THE PROJECT

Clear visual themes

Each website has a distinct identity that matches its business scenario.

Practical examples

The selected themes represent common real-world website requirements.

Good information grouping

Cards and sections make products, rooms, offers and contact information easy to distinguish.

Use of imagery

Relevant photographs make the pages more visually engaging.

Call-to-action elements

Buttons such as Order Now, Book Now and Reserve Now clearly indicate intended actions.

Repository organization

The activity files are separated into HTML and CSS documents and stored in a GitHub repository.

Consistent structure

Headers, navigation and footers provide a familiar structure across the projects.

12. LIMITATIONS AND SUGGESTED IMPROVEMENTS

The screenshots mainly demonstrate front-end presentation. For a production-quality website, additional technical features could be introduced.

Area	Recommended Enhancement
Responsive design	Add media queries and flexible layouts to ensure comfortable use on mobile devices.
Interactive navigation	Connect each navigation item to the correct section or separate page.
Functional forms	Add JavaScript validation and a backend/API to process submissions.
Database integration	Store orders, reservations and customer details securely.
Accessibility	Improve labels, keyboard navigation, contrast, alt text and semantic HTML.
Performance	Compress images and minimize unnecessary CSS/asset size.
Security	Use server-side validation, secure handling of customer information and appropriate authentication wher
Deployment	Host the projects using GitHub Pages or another web-hosting platform and test them on multiple devices

13. LEARNING OUTCOMES

The activities provide practice with several fundamental concepts that are useful for further web development. The project demonstrates how a basic static webpage can be planned around a real-world business scenario and then translated into structured HTML and CSS.

- Understanding page structure and semantic content organization.
- Creating navigation bars and consistent page headers.
- Designing reusable visual patterns such as cards and buttons.
- Displaying product/service information with images and pricing.
- Building form interfaces for collecting user information.
- Using colors, spacing, typography and alignment to establish visual hierarchy.
- Separating HTML structure from CSS presentation.
- Organizing activity files in a GitHub repository.
- Checking the final visual output in a browser.

These outcomes form a useful foundation for later topics such as JavaScript, responsive web design, backend development, databases, APIs and full-stack application development.

14. CONCLUSION

The consolidated project demonstrates a practical application of front-end web-development skills through three themed websites. The Foodie page focuses on online food ordering, the Sweet Treats Bakery page focuses on bakery products and custom cakes, and the Dream Stay Hotel page focuses on rooms, facilities and reservations.

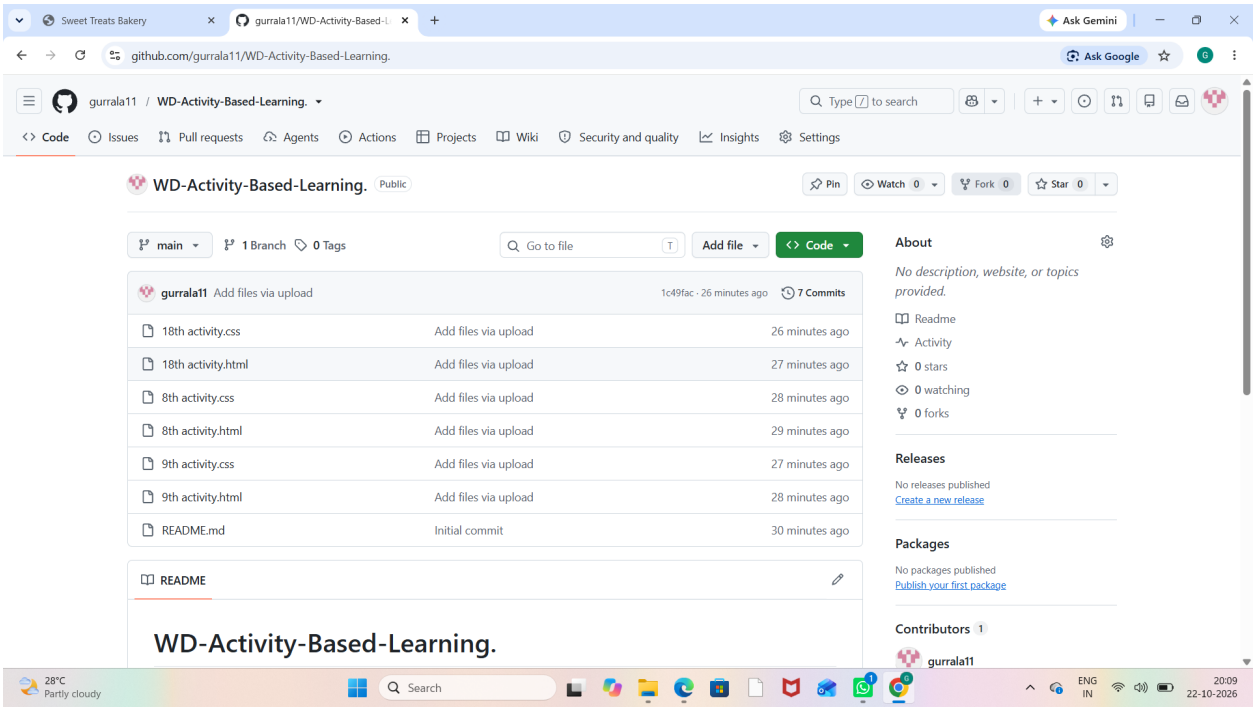

Across the activities, the work shows an understanding of page composition, navigation, visual hierarchy, product/service presentation, promotional content and user-input interfaces. The GitHub repository provides a central location for the activity files, while the browser screenshots provide visual evidence of the rendered results.

With additional responsive behavior, JavaScript interactions, validation, backend connectivity, database integration, accessibility improvements and deployment, these projects could be extended from classroom/static examples into more complete web applications.

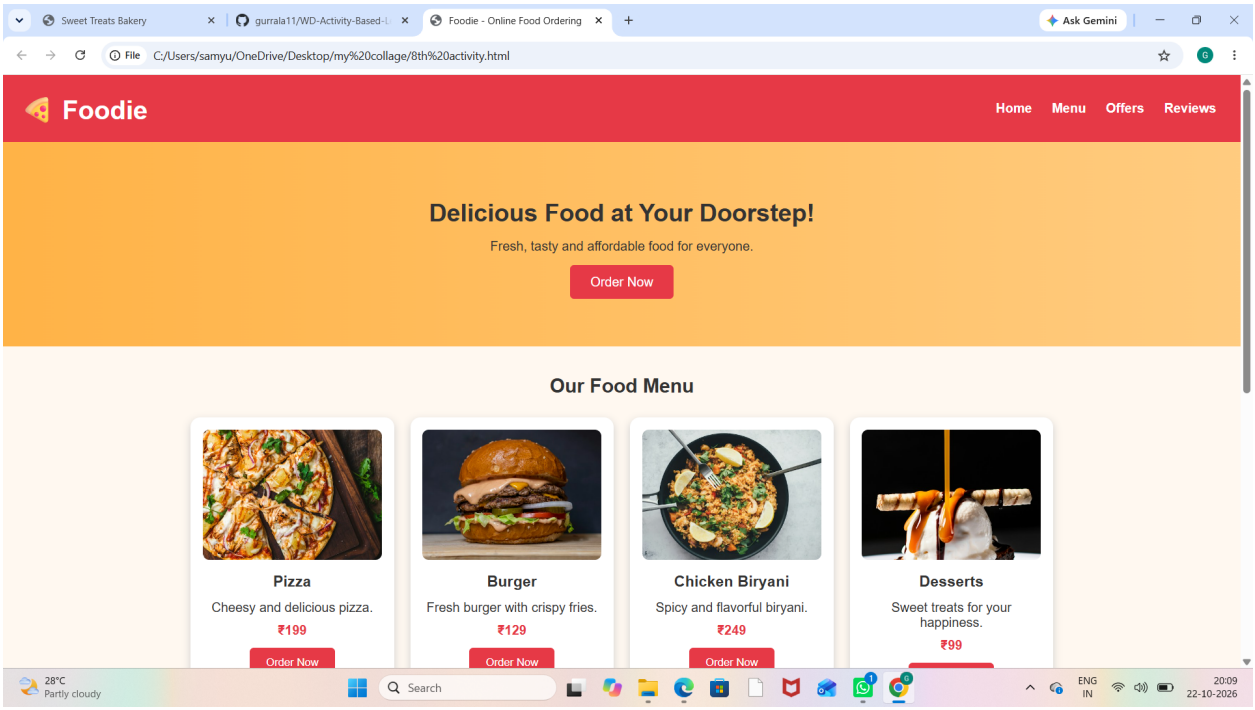

15. APPENDIX – SCREENSHOT EVIDENCE

The following pages preserve the supplied screenshots as evidence of the project repository and the three completed website activities.

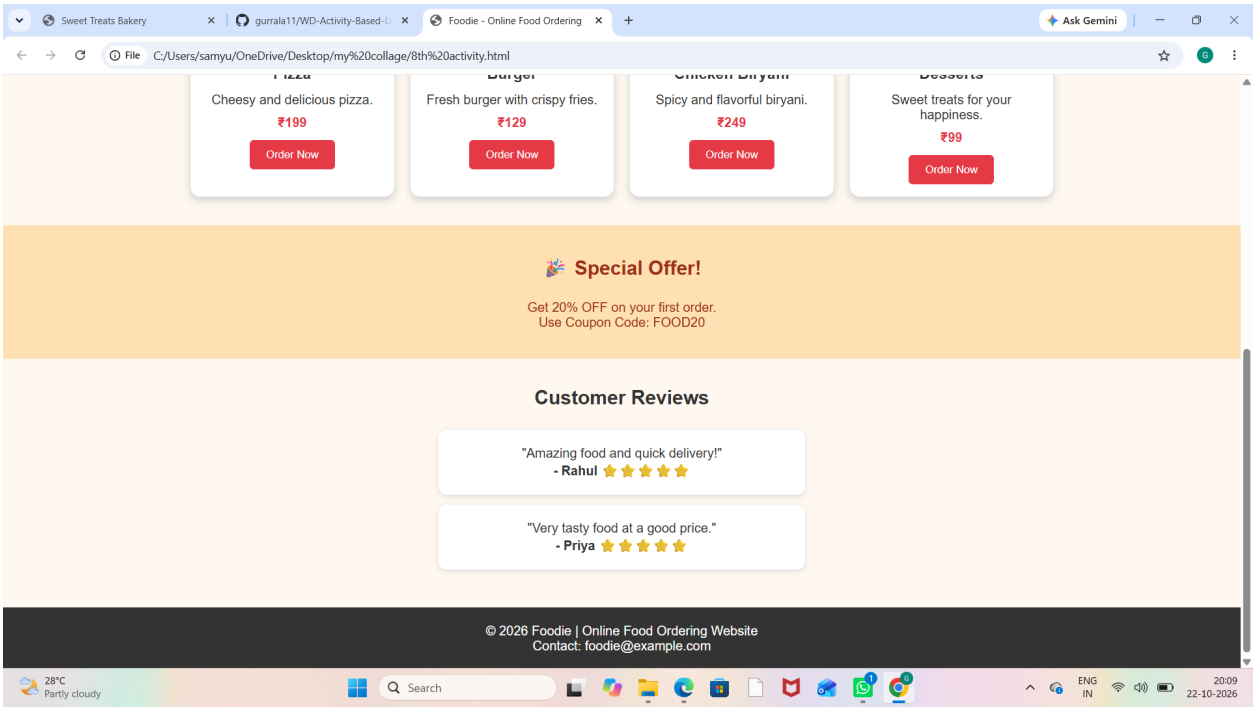

Appendix Figure A1 – GitHub repository overview.

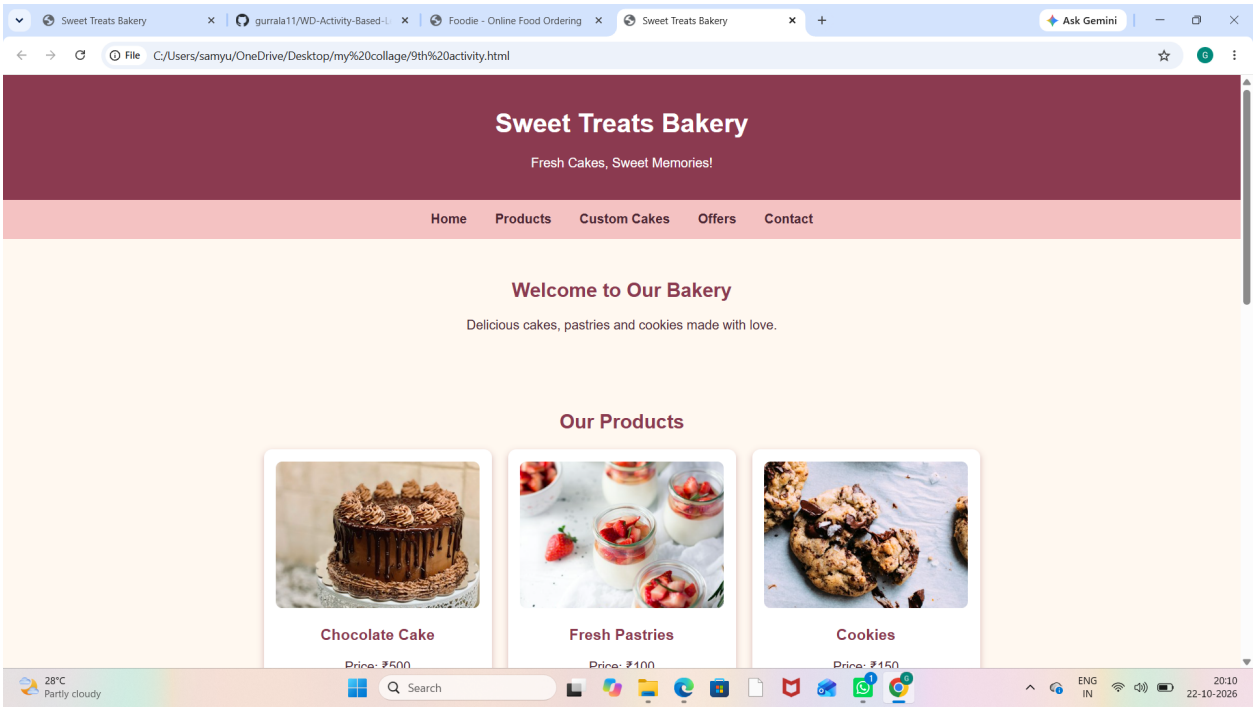

Appendix Figure A2 – Foodie website: homepage and menu.

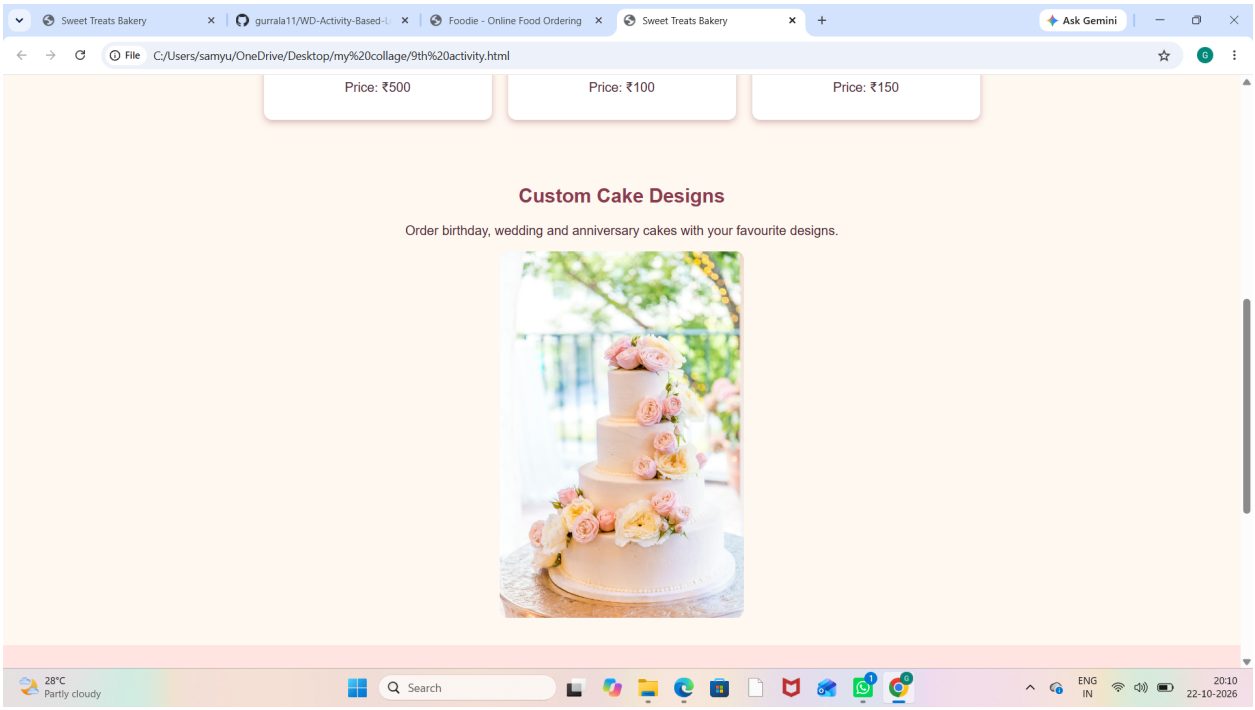

Appendix Figure A3 – Foodie website: offers, reviews and footer.

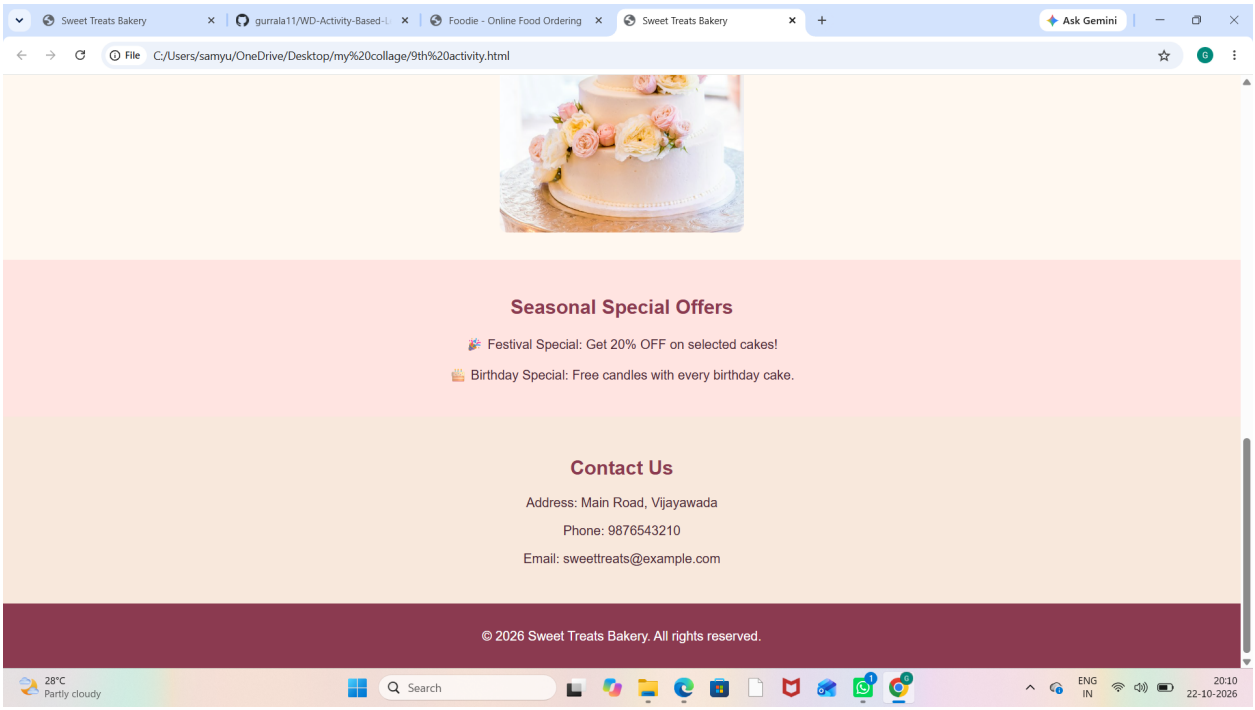

Appendix Figure A4 – Sweet Treats Bakery: homepage and products.

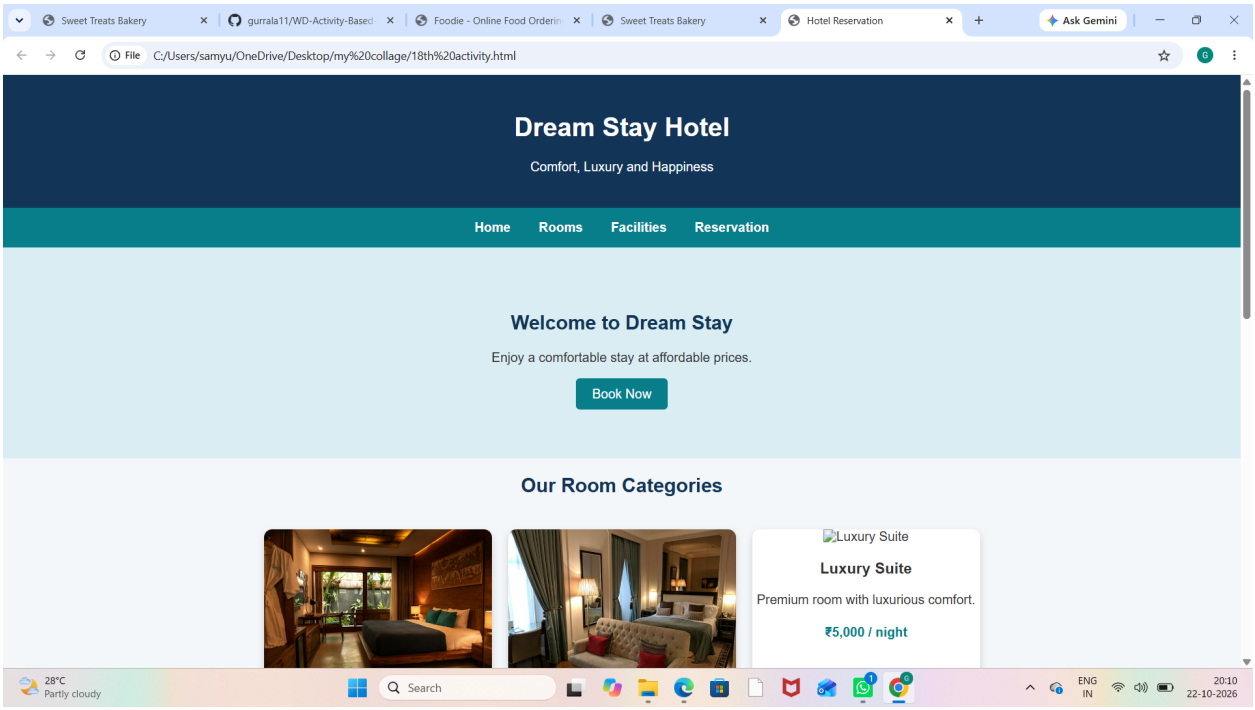

Appendix Figure A5 – Sweet Treats Bakery: custom cake design.

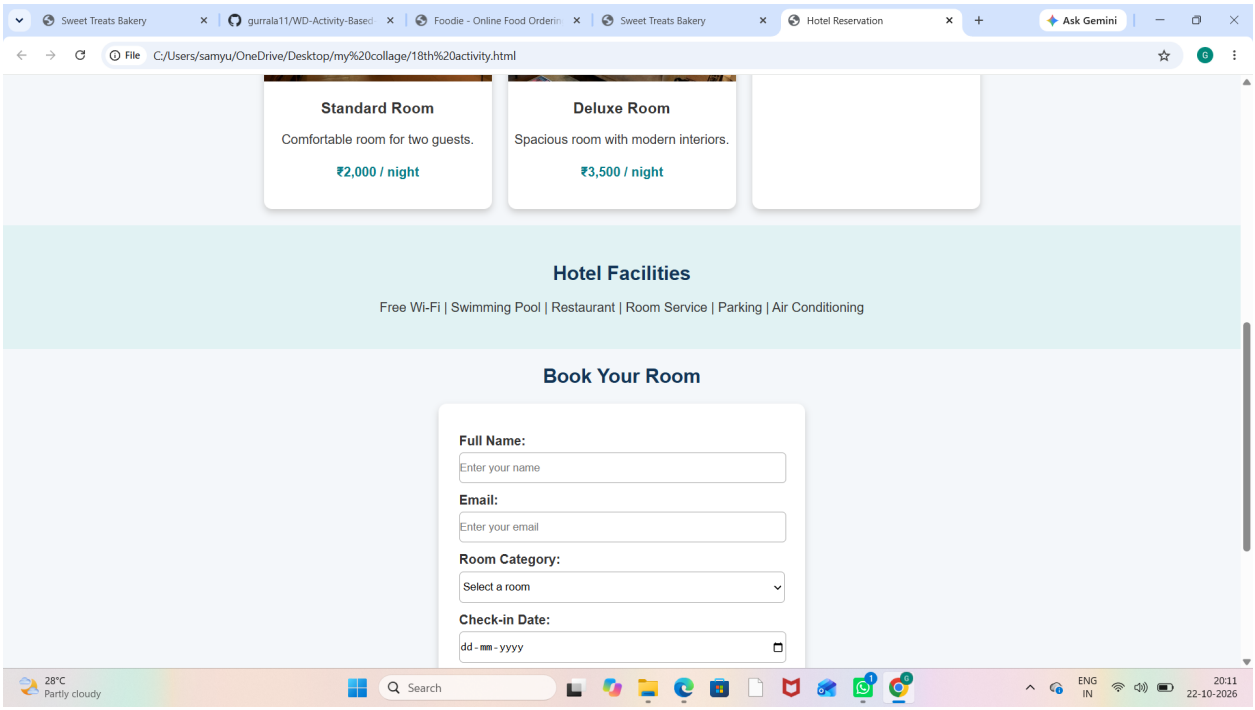

Appendix Figure A6 – Sweet Treats Bakery: offers, contact and footer.

Appendix Figure A7 – Dream Stay Hotel: homepage and room categories.

Appendix Figure A8 – Dream Stay Hotel: facilities and reservation section.

Appendix Figure A9 – Dream Stay Hotel: reservation form and footer.
